Be warned: Photoshop is a computer program, and anything that requires a computer is a good candidate for human error. A mistake made in Photoshop can have serious consequences, especially when it comes to manipulation of photos. * * * # Photoshop image formats and file types Just as there are various formats for audio or video files, there are various formats for image files, just as in those cases the basic format is the same, but each format has various attributes and settings that enable or constrain the file. That said, Photoshop's image formats and file types are easier to understand than those of the other major graphic programs. Adobe uses the following file formats in Photoshop: JPEG (the default) (see Figure 9-3) PNG (see Figure 9-4) GIF (now known as IPTC) To avoid confusion and increased file sizes, Photoshop uses JPEG for web images (see Figure 9-5) and PNG as its defacto format for everything else. That said, if you want to save and view an image in a different format, it's easy enough to do so in Photoshop. Note that because JPEG is the default, you can use the right-click button to create a file with the JPEG image format even if you select an image from a previous file. **Figure 9-3:** JPEG is the default image format. **Figure 9-4:** PNG is the default image format for images used in print. **Figure 9-5:** If you plan to save your images as web images, use the JPEG format. The file structure for a standard image in Photoshop is displayed in Figure 9-6. The hierarchy of the file is listed in the following order: **Figure 9-6:** File structure of a standard image. 1. Original 2. Background 3. Layers 4. Adjustments 5. Effects Understanding the various Photoshop image files and file types is crucial to using the program. The following sections help you identify the different parts of an image and provide insights into the relationships between the file types. **Figure 9-7:** The three primary files for an image are the background, layers, and adjustments. ## Understanding Backgrounds, Layers, and Adjustments The name `_background_` most often has its roots in English. The Gradient Tool is great for creating gradients (a common effect for buttons and backgrounds). There are two ways to use it: once in the RGB space and once in the HSL space. The Lasso Tool is probably the most versatile tool in Photoshop. It allows you to easily select objects and paths. It can also be used to create vector shapes. The Pen Tool lets you draw freeform paths. You can also convert any selection in an image to a path. The Pattern Brush is useful for applying textures to images. You can also use a picture for a pattern. The Reflection Tool lets you create reflections of an object. You can also use the Reflection Filter to create an image with a reflec... Adobe Photoshop is a powerful application that can be used for a wide variety of purposes. From creating graphics for website design, to fixing scanned photographs, to cleaning up family photos, it has a number of uses. Below are 17 ways to use Photoshop for a wide variety of purposes. The gallery in this article will focus on Photoshop, but you can also find out about the other Adobe apps at adobephotoshop.com. Graphic Design 1. Create Web Graphics By using the Photoshop File > Scripts > New Scripts... command, you can quickly create new graphics in Photoshop. You can then use these graphics in any Web page, including HTML, XHTML or CSS. Photoshop's default graphics are a bit "basic", but you can easily change the color scheme, font, and other things. You can also add text to your graphics. Because Photoshop can be used to create web graphics, it is a great place to learn about graphic design. 2. Fix Scanned Images Scanned images often have weird markings on them. These marks can be fixed by using the Spot Healing Brush. The Spot Healing Brush is a brush that will automatically detect and repair areas of a scanned image where there are errors. Photoshop's Photo Correction Filter can also be used for this purpose. These are both great ways to fix scanned images. 3. Fix a Zipper on a Scarf A number of online photo editing sites offer photo retouching. Some of the best are Splice, Fotolia, Picsmack, PicShop, and FotoWebs. Splice has a tool called the Zipper Eraser that can clean up a

Ligand-Target Complex-Induced Switching of Dark Red Phosphors for Large-Area White Light-Emitting Diodes. The large-area, highly efficient, and easy-to-fabricate white light-emitting diodes (WLEDs) can be realized by combining the rare-earth-free Eu-doped SrMoO₄ phosphor and Tm-doped NaYF₄/ZnS nanoparticles, emitting red photoluminescence (PL). This work shows that the Eu-doped SrMoO₄ phosphor can exhibit the red PL at 600 nm as a host after bonding with the (Zn,Mg)(Al,Mn)S nanoparticles. Through effective control of the bonding states and the morphologies of the host and host-guest bonding, the ZnMoO₄-host matrix with the donor-acceptor structure was fabricated, which can be excited to emit the red PL. It was found that the red PL of the ZnMoO₄-host can be switched to red-green PL after oxygen vacancy formation and then to blue PL by oxygen adsorption on the surface of the ZnMoO₄-host. The effective control of the red PL of the ZnMoO₄-host after oxygen vacancy formation and on its surface for large-area WLEDs can be attributed to the ZnMoO₄-host with the donor-acceptor structure. Our results are helpful for the application of Eu-doped SrMoO₄ phosphor in large-area WLEDs. Sensitive assay for recognition proteins at the surface of intact eukaryotic cells. By performing multicolor fluorescence microscopy on eukaryotic cells bearing defined numbers of recognition protein markers, we have established a quantitative assay for protein recognition on the surface of intact cells. This assay is based on the fact that the surface density of recognition proteins decreases as the number of recognition proteins on the cell surface increases. By imaging a population of cells containing a constant number of recognition protein spots, we have determined the relative fluorescence intensity of each individual spot as a function of the number of recognition proteins bound. These spot-intensity data, plotted as a function of the number of recognition proteins bound, are consistent with a binomial distribution. The formula derived from the binomial distribution is applied to the cell surface to generate a mathematical model that describes the cell surface recognition system quant
